

Denamarin

Protexin Denamarin provides multi-faceted support for the liver by providing a high quality combination of SAME and silybin:

- Pure stabilised salt of S-adenosylmethionine (SAME)
- Stabilised form of the S,S-SAME isomer, the predominant form synthesised in cells
- Silybin complex with phosphatidylcholine, shown to increase bioavailability
- The combined effect of SAME and silybin produce a synergistic effect.

The enteric coating of Denamarin prevents degradation of the product. Denamarin is blister packed to prevent oxidation of the SAME and is manufactured to high quality standards to ensure the label claim is met.
